How to process a tiny image with FC layers

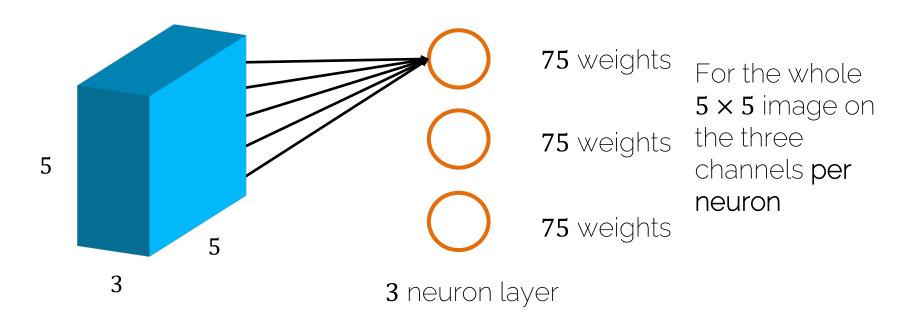

How to process a tiny image with FC layers

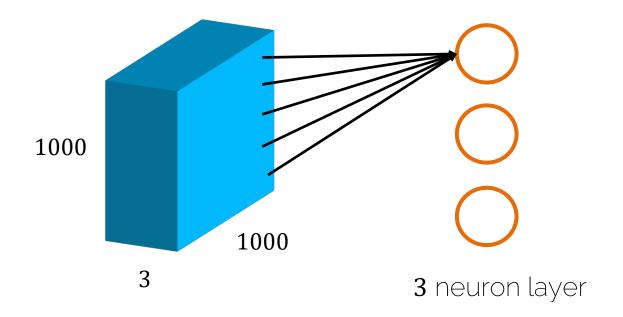

How to process a tiny image with FC layers

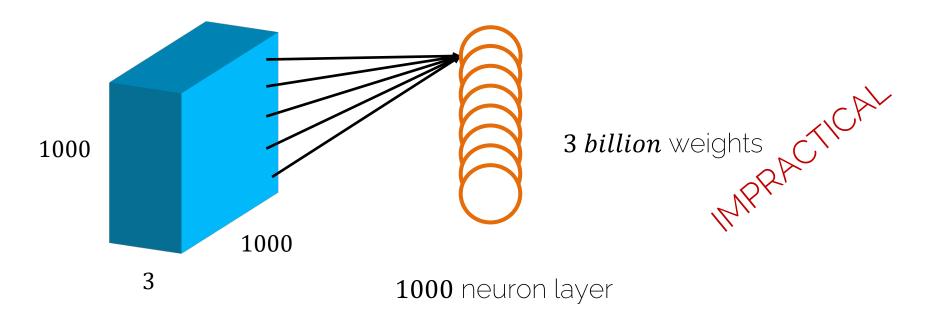

How to process a tiny image with FC layers

How to process a normal image with FC layers

How to process a normal image with FC layers

Why not simply more FC Layers?

We cannot make networks arbitrarily complex

- Why not just go deeper and get better?
 - No structure!!
 - It is just brute force!
 - Optimization becomes hard
 - Performance plateaus / drops!

Better Way than FC?

- We want to restrict the degrees of freedom
 - We want a layer with structure
 - Weight sharing → using the same weights for different parts of the image

Using CNNs in Computer Vision

Classification Instance **Object Detection** Classification + Localization Segmentation CAT, DOG, DUCK CAT, DOG, DUCK CAT CAT

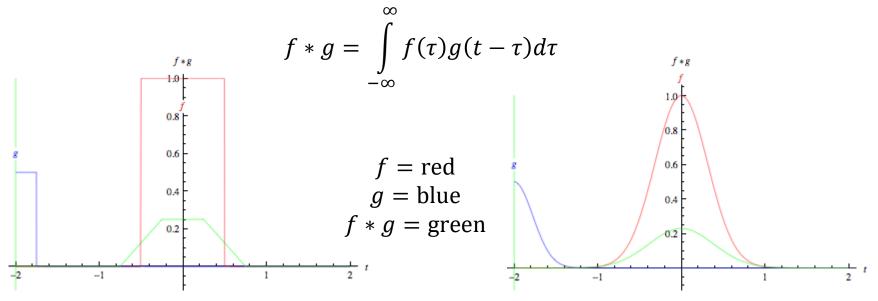

Single object

Multiple objects

[Li et al., CS231n Course Slides] Lecture 12: Detection and Segmentation

Convolutions

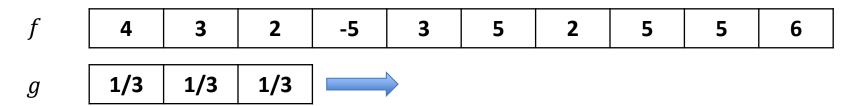

Convolution of two box functions

Convolution of two Gaussians

Application of a filter to a function

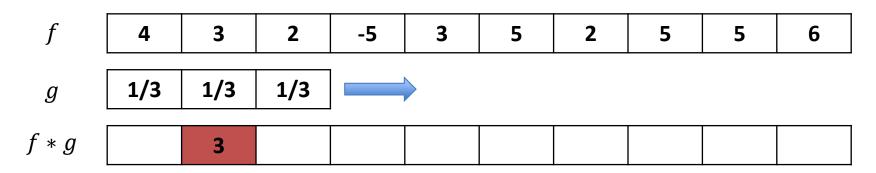

— The 'smaller' one is typically called the filter kernel

Discrete case: box filter

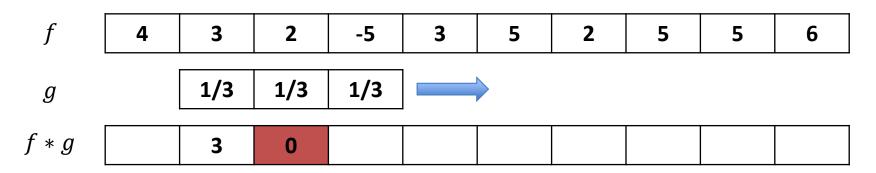

'Slide' **filter kernel** from left to right; at each position, compute a single value in the output data

Discrete case: box filter

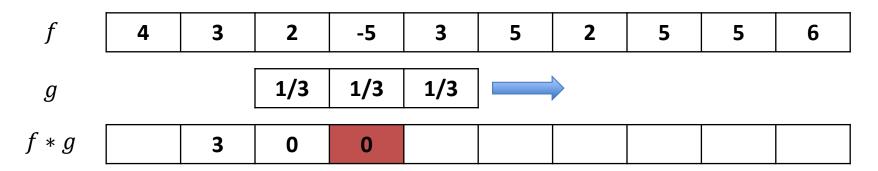

$$4 \cdot \frac{1}{3} + 3 \cdot \frac{1}{3} + 2 \cdot \frac{1}{3} = 3$$

Discrete case: box filter

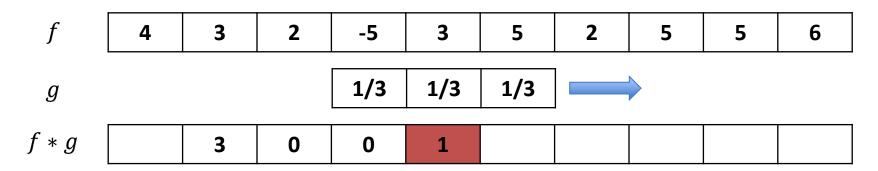

$$3 \cdot \frac{1}{3} + 2 \cdot \frac{1}{3} + (-5) \cdot \frac{1}{3} = 0$$

Discrete case: box filter

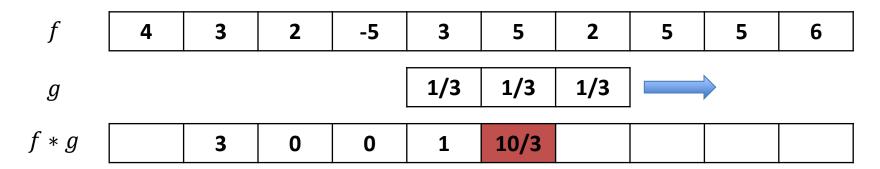

$$2 \cdot \frac{1}{3} + (-5) \cdot \frac{1}{3} + 3 \cdot \frac{1}{3} = 0$$

Discrete case: box filter

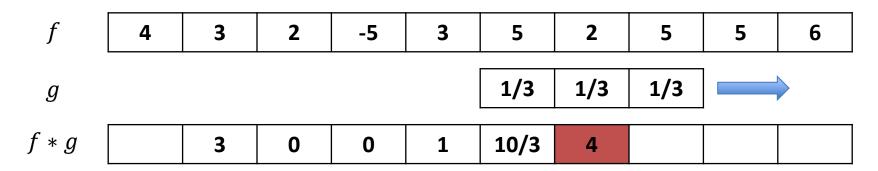

$$(-5) \cdot \frac{1}{3} + 3 \cdot \frac{1}{3} + 5 \cdot \frac{1}{3} = 1$$

Discrete case: box filter

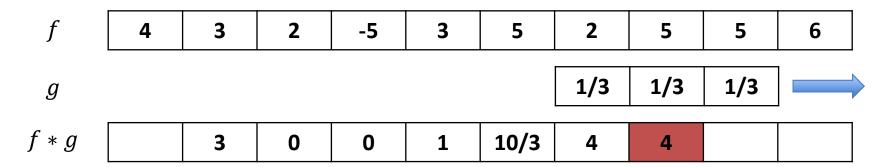

$$3 \cdot \frac{1}{3} + 5 \cdot \frac{1}{3} + 2 \cdot \frac{1}{3} = \frac{10}{3}$$

Discrete case: box filter

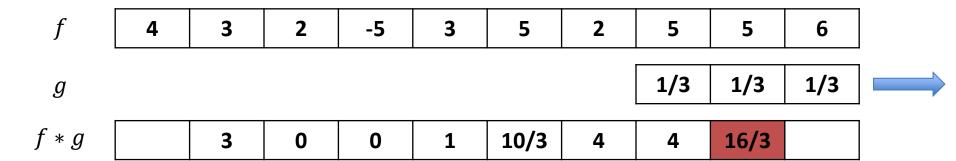

$$5 \cdot \frac{1}{3} + 2 \cdot \frac{1}{3} + 5 \cdot \frac{1}{3} = 4$$

Discrete case: box filter

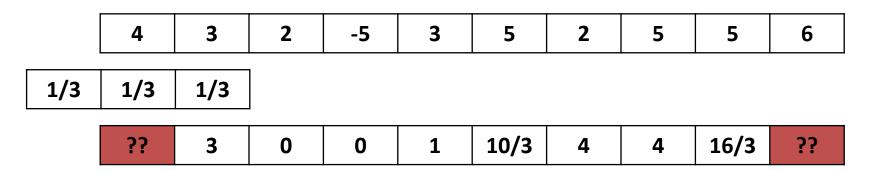

$$2 \cdot \frac{1}{3} + 5 \cdot \frac{1}{3} + 5 \cdot \frac{1}{3} = 4$$

Discrete case: box filter

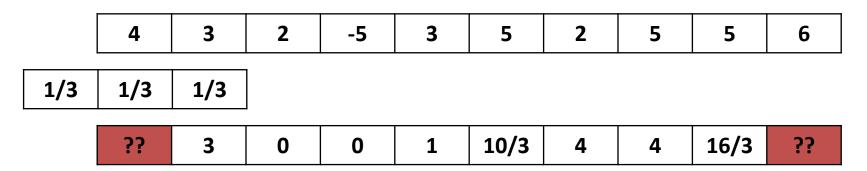

$$5 \cdot \frac{1}{3} + 5 \cdot \frac{1}{3} + 6 \cdot \frac{1}{3} = \frac{16}{3}$$

Discrete case: box filter

What to do at boundaries?

Discrete case: box filter

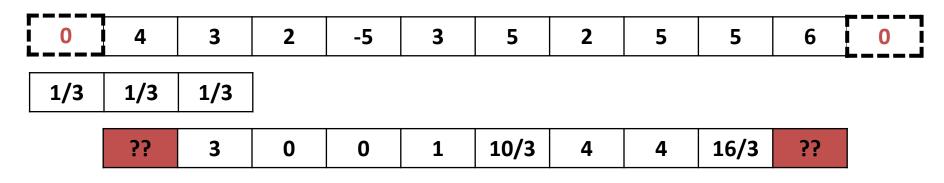

What to do at boundaries?

Option 1: Shrink

						_	
3	0	0	1	10/3	4	4	16/3

Discrete case: box filter

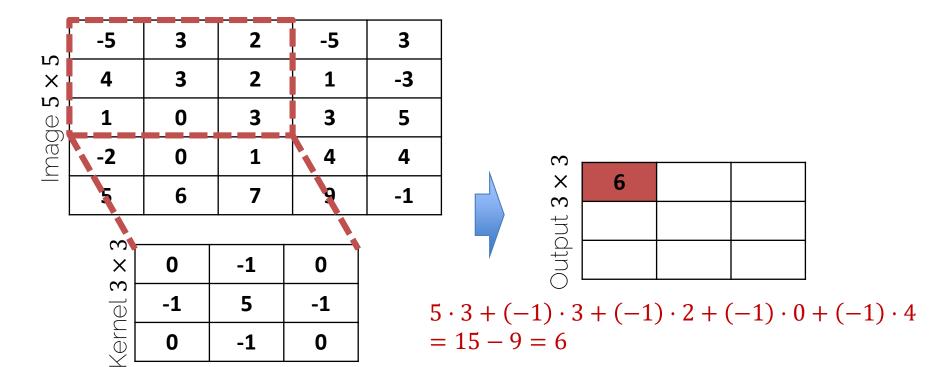

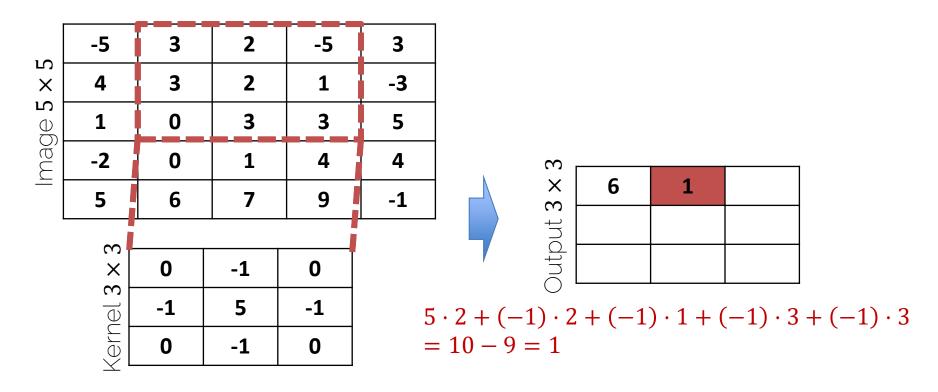

$$0 \cdot \frac{1}{3} + 4 \cdot \frac{1}{3} + 3 \cdot \frac{1}{3} = \frac{7}{3}$$

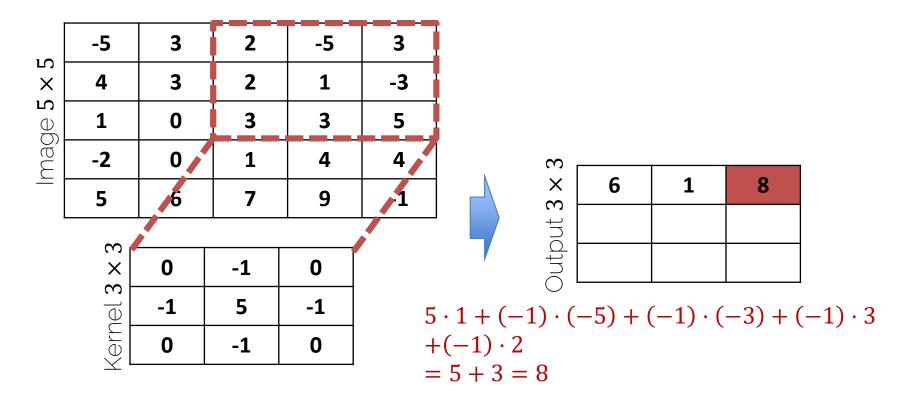

What to do at boundaries?

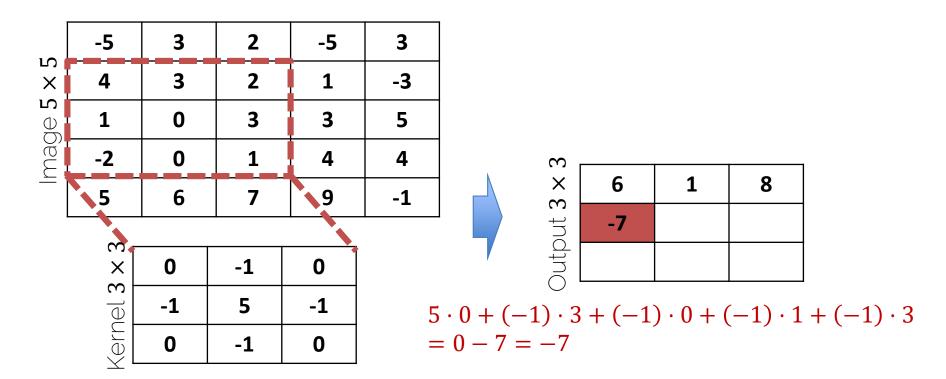

Option 2: Pad (often o's)

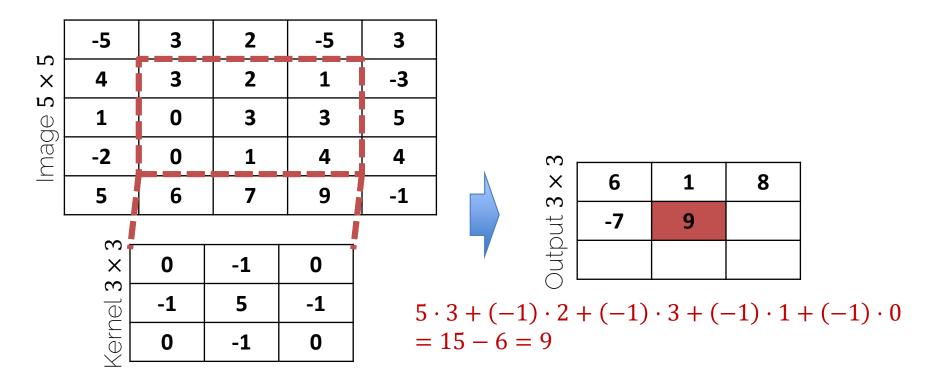

7/3	3	0	0	1	10/3	4	4	16/3	11/3
-----	---	---	---	---	------	---	---	------	------

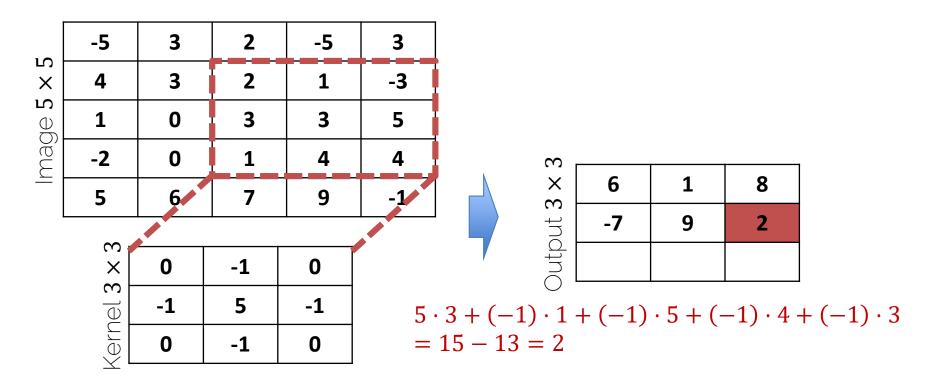

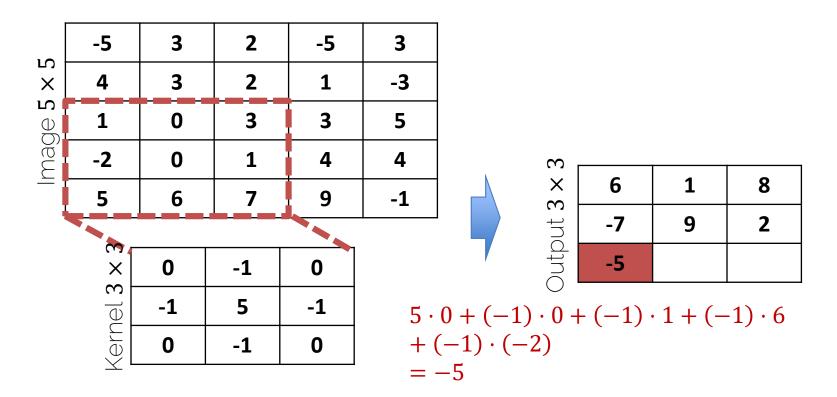

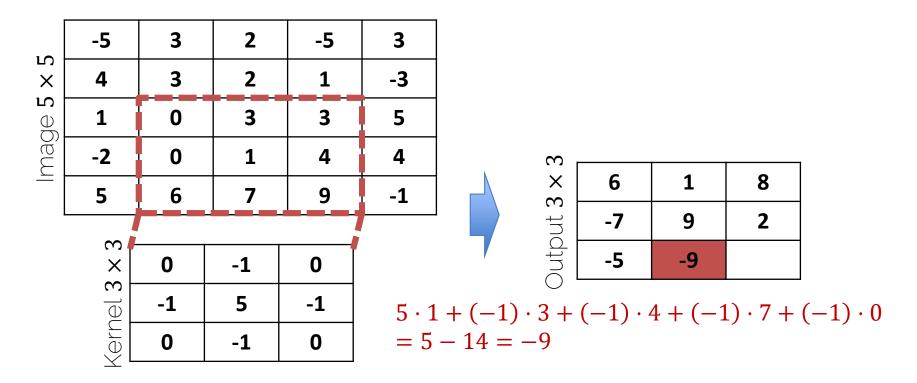

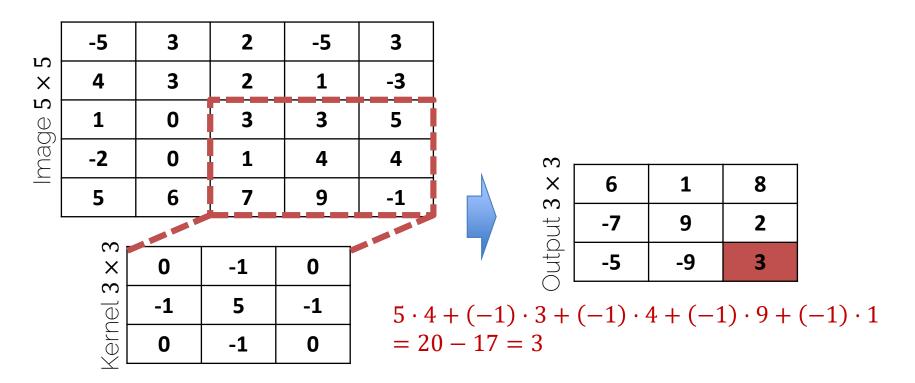

Image Filters

Each kernel gives us a different image filter

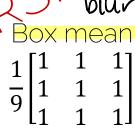

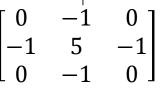

Edge detection

$$\begin{bmatrix} -1 & -1 & -1 \\ -1 & 8 & -1 \\ -1 & -1 & 1 \end{bmatrix}$$

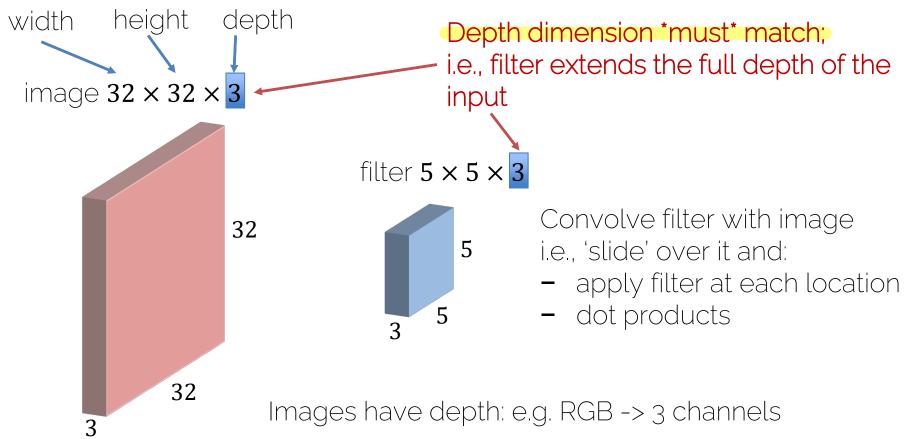

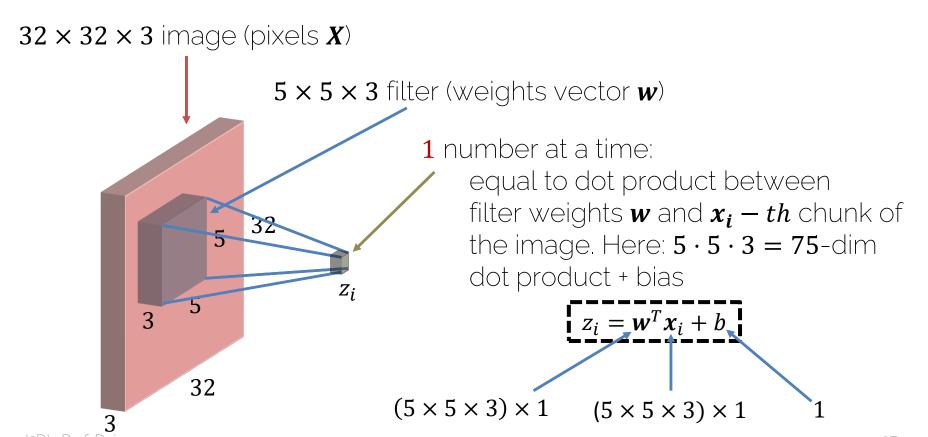

Gaussian blur

$$\frac{1}{16} \begin{bmatrix} 1 & 2 & 1 \\ 2 & 4 & 2 \\ 1 & 2 & 1 \end{bmatrix}$$

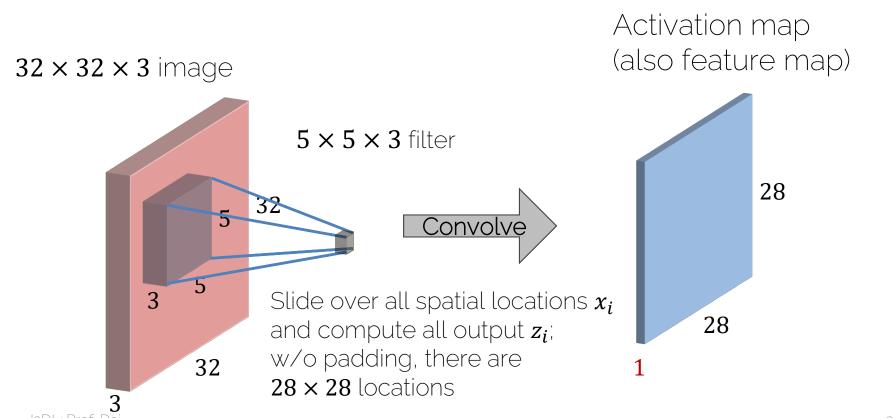

36

Convolutions on RGB Images

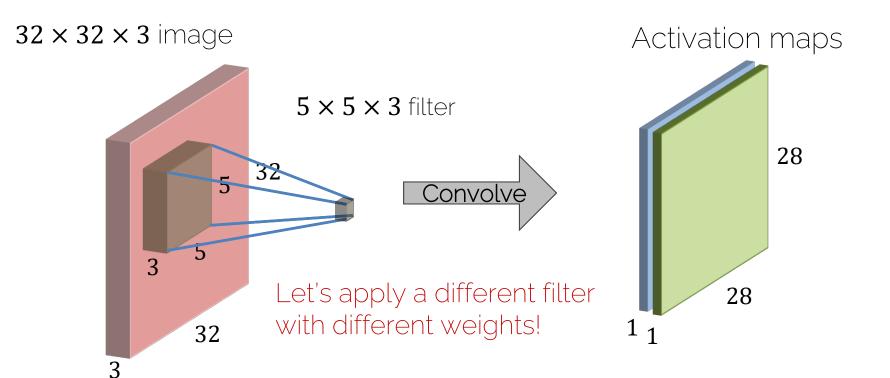

3/

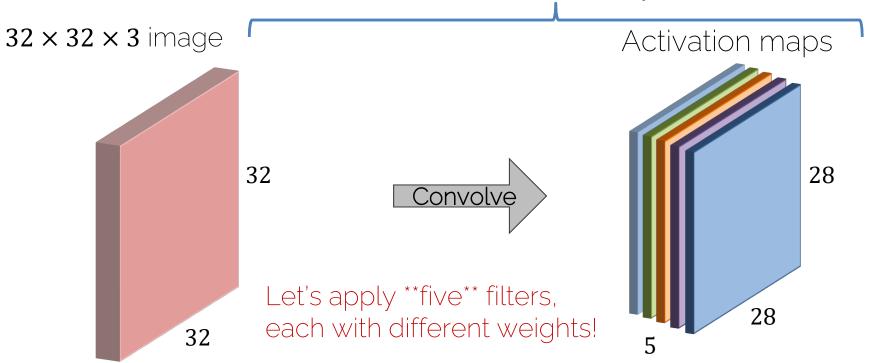

Convolutions on RGB Images

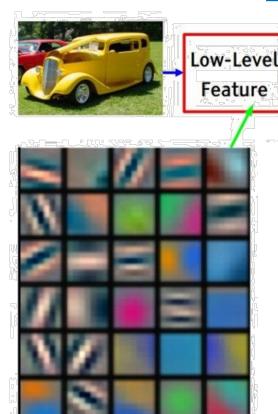

Convolution "Layer"

- A basic layer is defined by
 - Filter width and height (depth is implicitly given)
 - Number of different filter banks (#weight sets)

• Each filter captures a different image characteristic

Different Filters

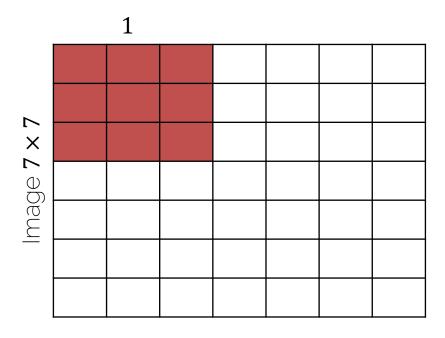

- Each filter captures different image characteristics:
 - Horizontal edges
 - Vertical edges
 - Circles
 - Squares
 - _____

[Zeiler & Fergus, ECCV'14] Visualizing and Understanding Convolutional Networks

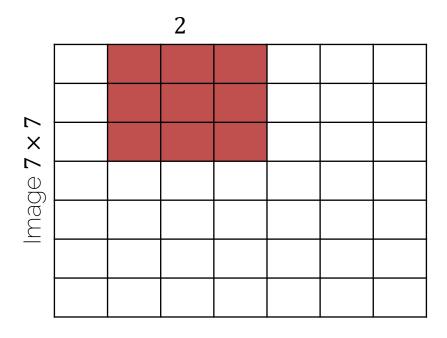

Dimensions of a Convolution Layer

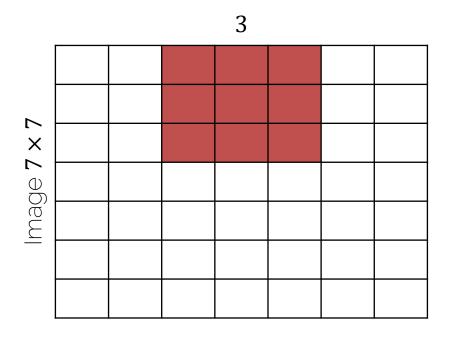

Input: 7×7

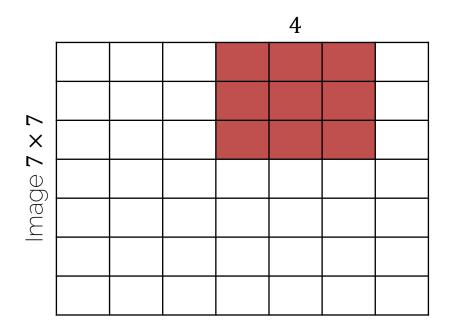

Filter: 3×3 Output: 5×5

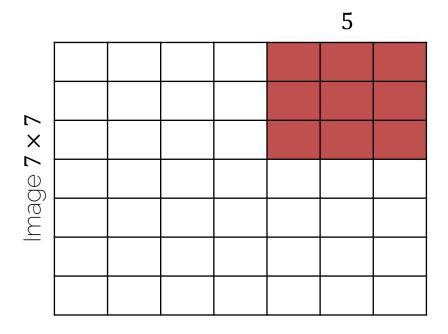

Input: 7×7 Filter: 3×3 Output: 5×5

Input: 7×7 Filter: 3×3 Output: 5×5

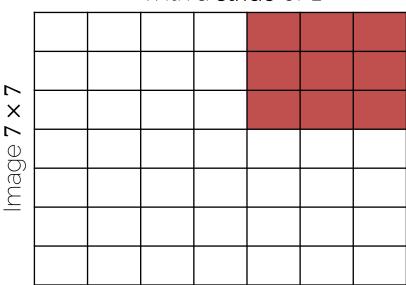

Input: 7×7 Filter: 3×3 Output: 5×5

Input: 7×7

Filter: 3×3 Output: 5×5

Input: 7×7

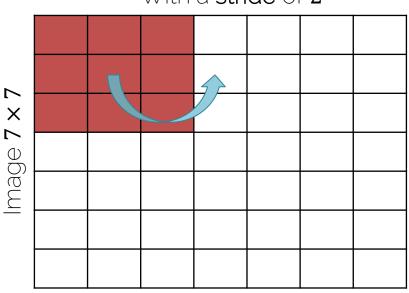

Filter: 3×3

Stride: 1

Output: 5×5

Stride of *S*: apply filter every *S*-th spatial location; i.e. subsample the image

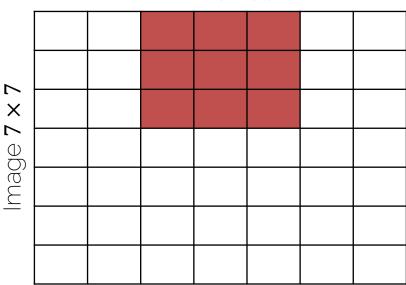

Input: 7×7

Filter: 3×3

Stride: 2

Output: 3×3

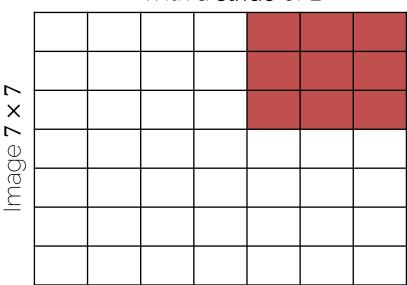

Input: 7×7

Filter: 3×3

Stride: 2

Output: 3×3

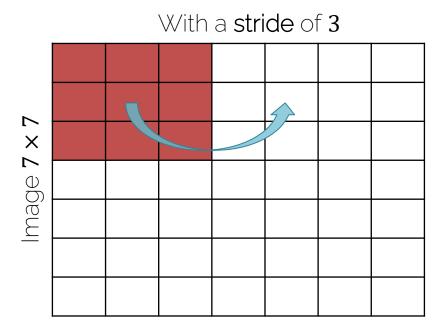

Input: 7×7

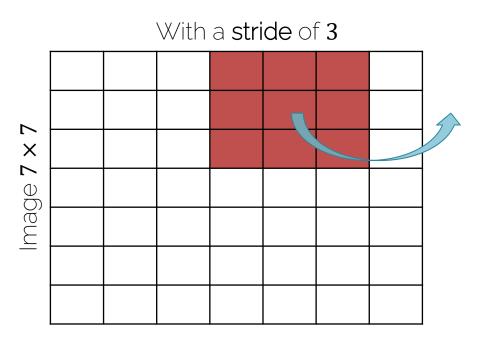

Filter: 3×3

Stride: 2

Output: 3×3

Input: 7 × 7
Filter: 3 × 3
Stride: 3
Output: ? × ?

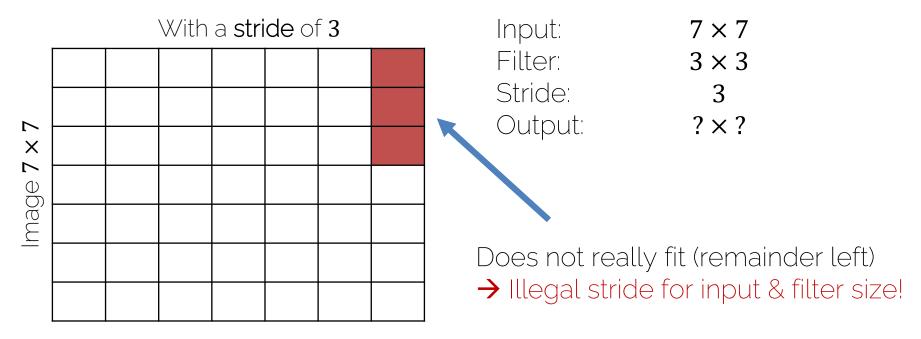

Input: 7×7

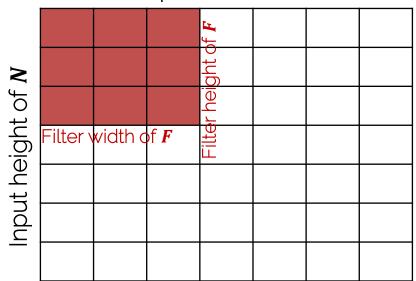

Filter: 3×3

Stride:

Output: $? \times ?$

Input:
$$N \times N$$

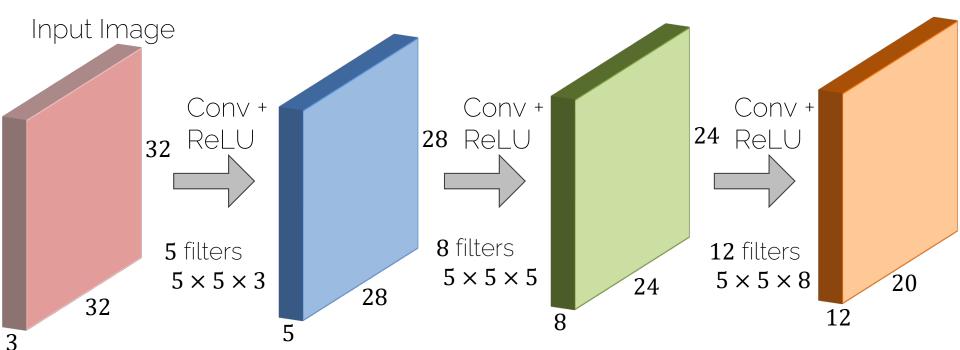

Filter: $F \times F$

Stride: S

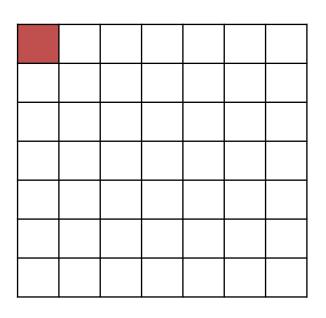

Output: $\left(\frac{N-F}{S}+1\right) \times \left(\frac{N-F}{S}+1\right)$

$$N = 7, F = 3, S = 1$$
: $\frac{7-3}{1} + 1 = 5$
 $N = 7, F = 3, S = 2$: $\frac{7-3}{2} + 1 = 3$
 $N = 7, F = 3, S = 3$: $\frac{7-3}{3} + 1 = 2.\overline{3}$

Fractions are illegal

Shrinking down so quickly $(32\rightarrow28\rightarrow24\rightarrow20)$ is typically not a good idea...

Why padding?

- Sizes get small too quickly
- Corner pixel is only used once

+ Zero padding X Image

0	0	0	0	0	0	0	0	0
0								0
0								0
0								0
0								0
0								0
0								0
0								0
0	0	0	0	0	0	0	0	0

Why padding?

- Sizes get small too quickly
- Corner pixel is only used once

7 + zero padding X

0	0	0	0	0	0	0	0	0
0								0
0								0
0								0
0								0
0								0
0								0
0								0
0	0	0	0	0	0	0	0	0

Input $(N \times N)$: 7×7 Filter $(F \times F)$: 3×3

Padding (P): 1

Stride (*S*): 1

Output 7×7

Most common is 'zero' padding

Output Size:

$$\left(\left\lfloor \frac{N+2\cdot P-F}{S}\right\rfloor + 1\right) \times \left(\left\lfloor \frac{N+2\cdot P-F}{S}\right\rfloor + 1\right)$$

[] denotes the floor operator (as in practice an integer division is performed)

7 + zero padding X Image

0	0	0	0	0	0	0	0	0
0								0
0								0
0								0
0								0
0								0
0								0
0								0
0	0	0	0	0	0	0	0	0

Types of convolutions:

Valid convolution: using no padding

 Same convolution: output=input size

Set padding to
$$P = \frac{F-1}{2}$$

Example

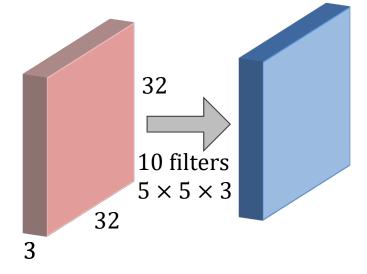

Input image: $32 \times 32 \times 3$

10 filters 5×5

Stride 1

Pad 2

Depth of 3 is implicitly given

Output size is:

$$\frac{32 + 2 \cdot 2 - 5}{1} + 1 = 32$$

 $i \in 32 \times 32 \times 10$

Remember

Output:
$$\left(\left\lfloor \frac{N+2\cdot P-F}{S}\right\rfloor +1\right) \times \left(\left\lfloor \frac{N+2\cdot P-F}{S}\right\rfloor +1\right)$$

Example

Input image: $32 \times 32 \times 3$

10 filters 5×5

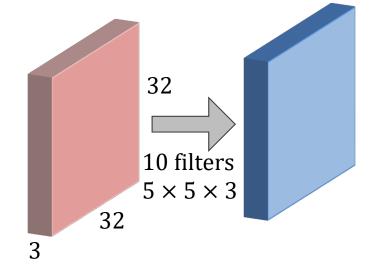

Stride 1

Pad 2

Output size is:

$$\frac{32 + 2 \cdot 2 - 5}{1} + 1 = 32$$

ie $32 \times 32 \times 10$

Remember

Output:
$$\left(\left\lfloor \frac{N+2\cdot P-F}{S}\right\rfloor +1\right) imes \left(\left\lfloor \frac{N+2\cdot P-F}{S}\right\rfloor +1\right)$$

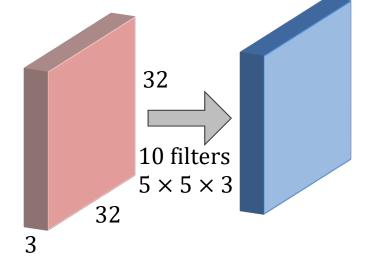

Example

Input image: $32 \times 32 \times 3$

10 filters 5 × 5

Stride 1

Pad 2

Number of parameters (weights):

Each filter has $5 \times 5 \times 3 + 1 = 76$ params (+1 for bias)

 \rightarrow 76 · 10 = 760 parameters in layer

Example

 You are given a convolutional layer with 4 filters, kernel size 5, stride 1, and no padding that operates on an RGB image.

 Q1: What are the dimensions and the shape of its weight tensor? 1: Her - 5 x5 x3

 \square \triangle 1: (3, 4, 5, 5)

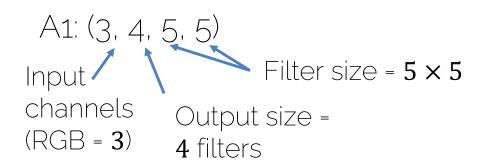

□ A2: (4, 5, 5)

■ A3: depends on the width and height of the image

fl filters - 4

Example

- You are given a convolutional layer with 4 filters, kernel size 5, stride 1, and no padding that operates on an RGB image.
- Q1: What are the dimensions and the shape of its weight tensor?

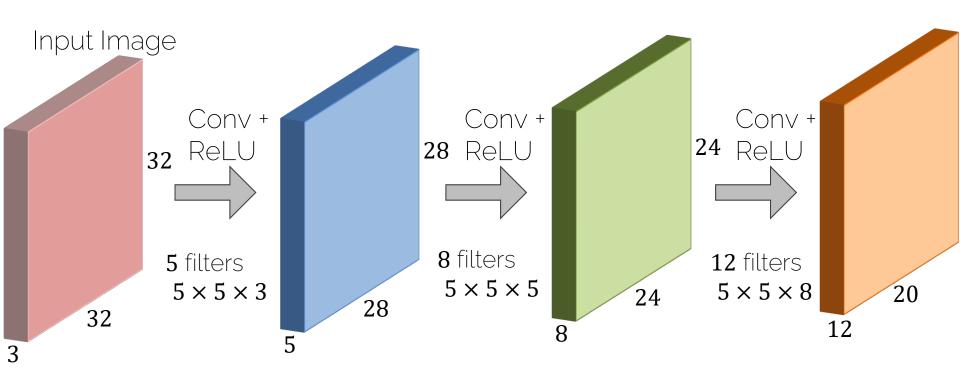

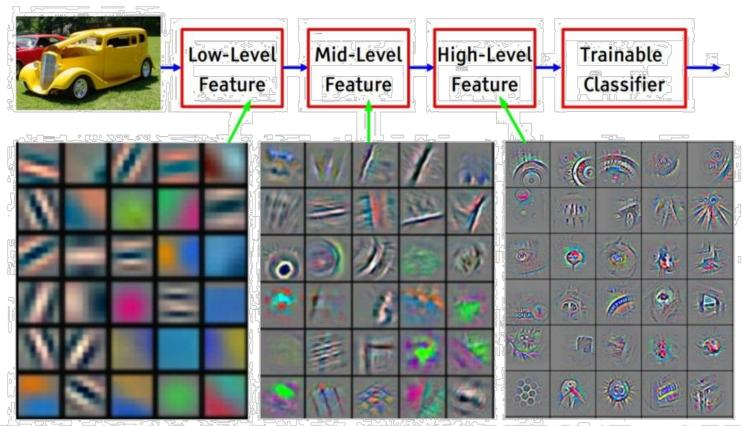

Convolutional Neural Network (CNN)

CNN Prototype

ConvNet is concatenation of Conv Layers and activations

CNN Learned Filters

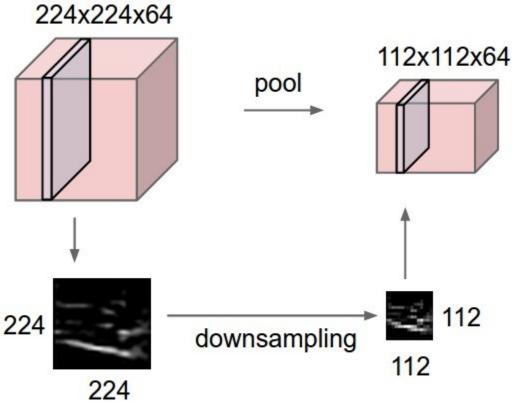

[Zeiler & Fergus, ECCV'14] Visualizing and Understanding Convolutional Networks

Pooling

Pooling Layer

[Li et al., CS231n Course Slides] Lecture 5: Convolutional Neural Networks I2DL: Prof. Dai

Pooling Layer: Max Pooling

Single depth slice of input

3	1	3	5
6	0	7	9
3	2	1	4
0	2	4	3

Max pool with 2 × 2 filters and stride 2

'Pooled' output

6	9	
3	4	

Pooling Layer

- Conv Layer = 'Feature Extraction'
 - Computes a feature in a given region

- Pooling Layer = 'Feature Selection'
 - Picks the strongest activation in a region

Pooling Layer

- Input is a volume of size $W_{in} \times H_{in} \times D_{in}$
- Two hyperparameters

- Spatial filter extent F- Stride CFilter count C and padding C make no sense here

• Output volume is of size $W_{out} \times H_{out} \times D_{out}$

$$-W_{out} = \frac{W_{in} - F}{S} + 1$$

$$- H_{out} = \frac{H_{in} - F}{\varsigma} + 1$$

- $-D_{out}=D_{in}$
- Does not contain parameters; e.g. it's fixed function

Pooling Layer

- Input is a volume of size $W_{in} \times H_{in} \times D_{in}$
- Two hyperparameters
 - Spatial filter extent F
 - Stride S

Common settings:

$$F = 2, S = 2$$

 $F = 3, S = 2$

$$F = 3, S = 2$$

• Output volume is of size $W_{out} \times H_{out} \times D_{out}$

$$-W_{out} = \frac{W_{in} - F}{S} + 1$$

$$-H_{out} = \frac{H_{in} - F}{S} + 1$$

$$-D_{out}=D_{in}$$

Does not contain parameters; e.g. it's fixed function

Pooling Layer: Average Pooling

Single depth slice of input

3	1	3	5
6	0	7	9
3	2	1	4
0	2	4	3

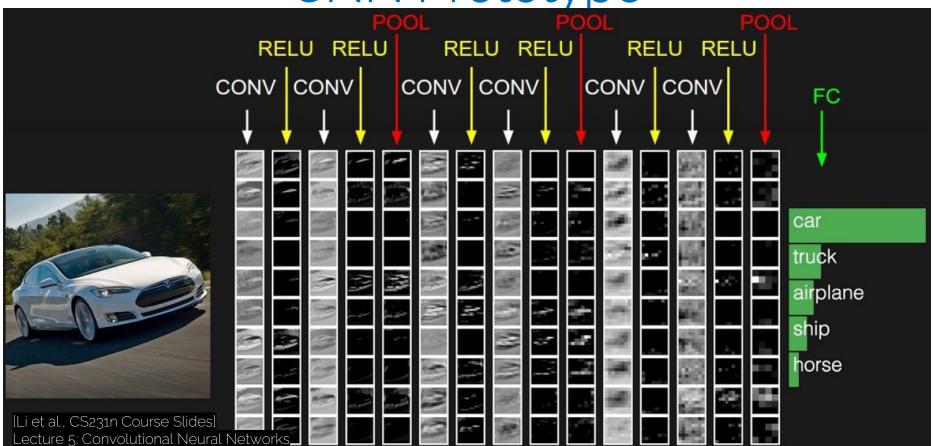

Average pool with 2 × 2 filters and stride 2

'Pooled' output

2.5	6	
1.75	3	

Typically used deeper in the network

CNN Prototype

Final Fully-Connected Layer

- Same as what we had in 'ordinary' neural networks
 - Make the final decision with the extracted features from the convolutions
 - One or two FC layers typically

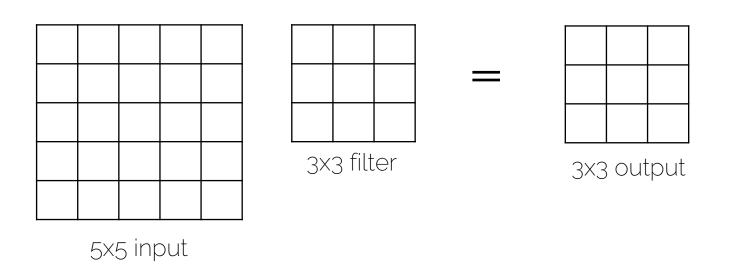

Convolutions vs Fully-Connected

- In contrast to fully-connected layers, we want to restrict the degrees of freedom
 - FC is somewhat brute force
 - Convolutions are structured

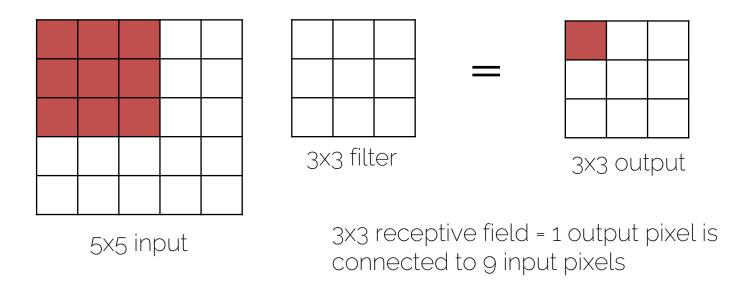

- Sliding window to with the same filter parameters to extract image features
 - Concept of weight sharing
 - Extract same features independent of location

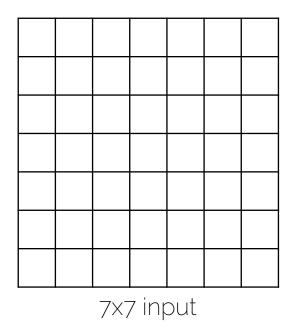

Spatial extent of the connectivity of a convolutional filter

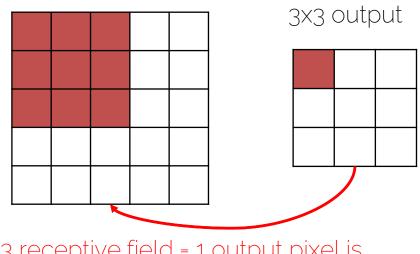

Spatial extent of the connectivity of a convolutional filter

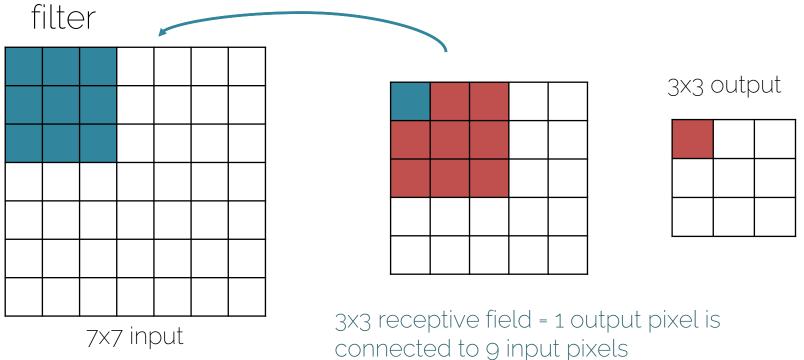

Spatial extent of the connectivity of a convolutional filter

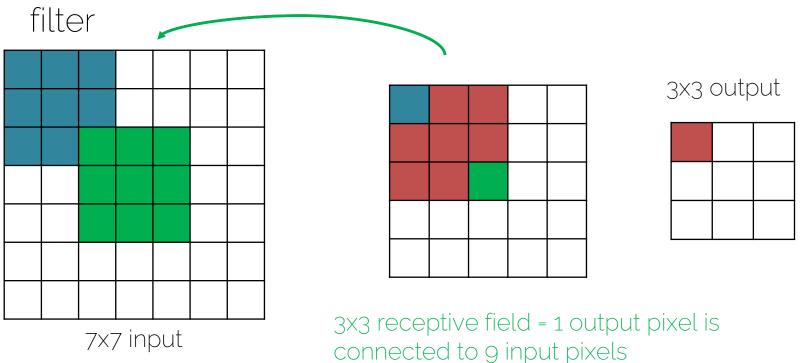

3x3 receptive field = 1 output pixel is connected to 9 input pixels

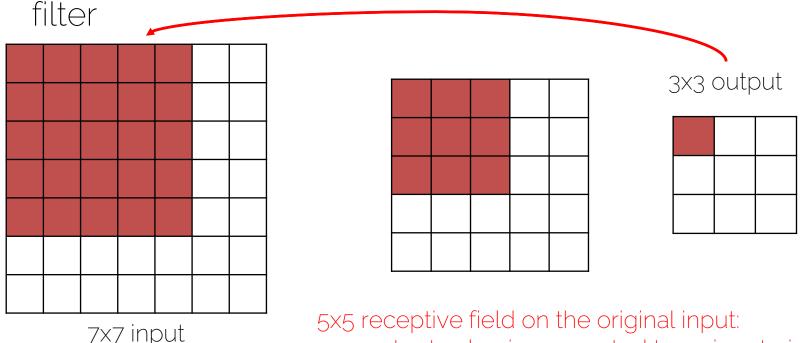

Spatial extent of the connectivity of a convolutional

Spatial extent of the connectivity of a convolutional

Spatial extent of the connectivity of a convolutional

one output value is connected to 25 input pixels

See you next time!
